## Lecture 4: Fundamentals of Machine Learning Pt. 1

**INFO 1998: Introduction to Machine Learning** 

## Mid Semester Project Check-In 👀

- Starting next week (can complete anytime from 10/07 10/18)!
- Attend OH, and fill out a Google Form (will be posted on EdStem)
  - Expecting hypothesis/question/problem to solve
  - Chosen dataset
  - Some progress on data cleaning/data visualization

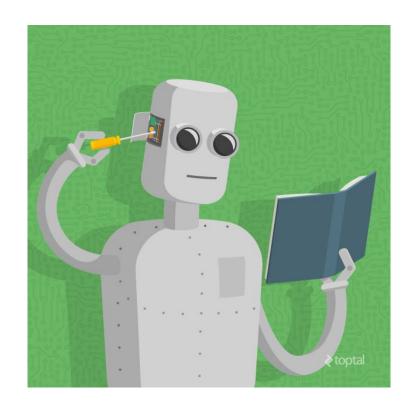

## **Agenda**

#### Today's Goal: be able to write code to do some kind of ML (to some extent)

- **Define Machine Learning:** or like, 5 definitions
- Start learning the language of ML: There's a lot of terminology!
- Try Linear Regression (via ScikitLearn): Our first ML algorithm!
- Introduce our Workflow: An outline for developing an ML model
- Discuss Some Important Considerations: What should we be thinking about as we're MLing?

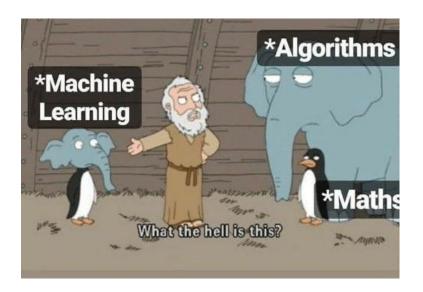

## What's Machine Learning? Part 1: what does an ML engineer do

### **Some Definitions of ML**

- Give computers the ability to learn without being explicitly programmed
- Build a useful mathematical model, based on sample data, to make inferences
- Take in data and make predictions or decisions
- Help your computer learn patterns

### What we're gonna do:

#### Our main tasks:

- Formulate a problem
- Find and understand data for that problem
- Choose a specific algorithm class to solve the problem
- Choose different parts of the data to best solve the problem
- Find which pandas, numpy, and scikit-learn functions do what we want
- Interpret the results and fine-tune our model

#### Write as little code as possible!

- Use pandas to deal with data
- Use numpy to do math
- Use scikit-learn ("sklearn") to make & analyze ML models

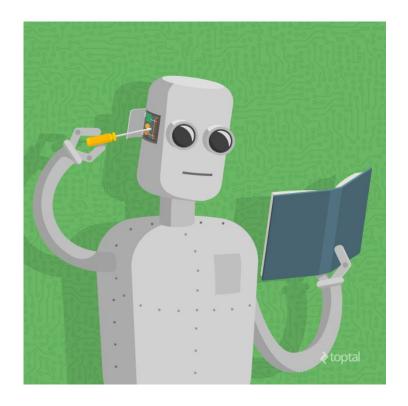

## **Quick analogy: studying**

- Setup
  - Goal: Be able to solve the test problems well
  - Resources: Practice problems + answers
- Method
  - You study those practice problems and answers. Given a problem, how do you get the answer?
- Result:
  - On the real test, the problems aren't the exact same as the practice problems. But they're similar!
  - Since you learned generally how to solve the practice problems, you can solve the similar test problems too :)

## What's Machine Learning? Part 2: like seriously what is it

## **Traditional Computer Science**

## **Machine Learning**

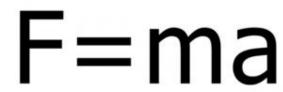

## **Using Machine Learning**

### **Traditional CS Machine Learning** New **Data Data Output** Program Known **Output** Computer Computer

### Physics: A White-Box View of the World

- We have studied the world and crafted **models** by ourselves to represent it
- Our models are interpretable
- White-box algorithms: The inner workings of the algorithm are transparent

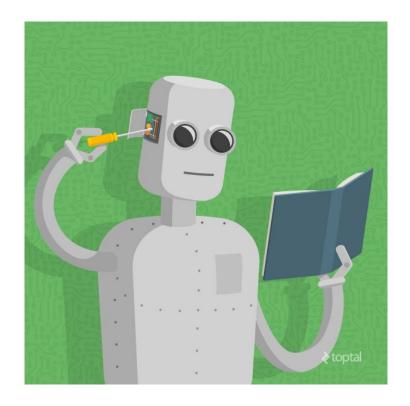

#### **Black Box Models**

- Perhaps we can derive a process to solve the problem
  - Determine what a function would roughly look like
  - Think of relevant inputs
  - Allow the function to build itself
- Black Box Model: Results may not be interpretable!

## What's Machine Learning? Part 3: what's a model?

### What's a model?

- The output of a machine learning algorithm
- A procedure to produce some outputs when given some inputs
- A relationship between inputs and outputs
- A guess at how inputs and outputs are related
- A set of assumptions we're imposing on the dataset
- A parametrized function we can configure

### **Review: Dataset Structure**

- Rows are data points
  - AKA samples
- Columns are features
  - A sample is made of lots of features, including the goal

	Name	Age	Major

## **ML Algorithms**

- We pick different kinds of algorithms to accomplish different tasks
- Classification
  - Group Data Into Distinct Classes
- Regression
  - Based on an input, provide a continuous-value output
- "All Models Make Assumptions"

## **Linear Regression**

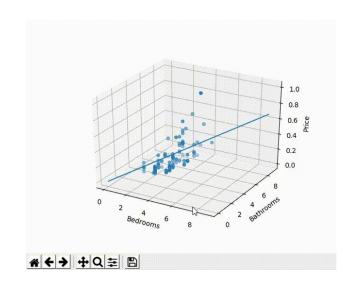

Our first ML model!

## **Linear Regression**

$$y = B_0 + B_I x_I + \dots + B_p x_p + \varepsilon$$

- x is an input;  $x_1, x_2, ..., x_p$  are the features of x
- y is an output (usually a single value)
- B's are "weights"
  - a linear regression equation is defined by its B's
  - "program" produced by ML
- Given a set of x's and y's, find the "B"-s that "most closely" satisfies the equation above for training points
- Plug in new values to of x to predict respective y

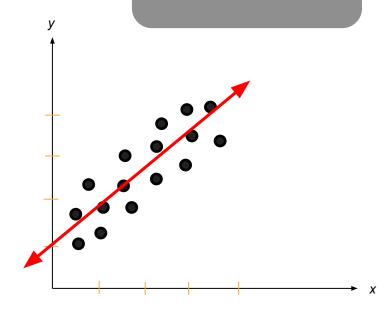

$$y = B_0 + B_1 x_1 + ...$$
 is a model

- A relationship between inputs and outputs  $y = B_0 + B_1 x_1 + ...$  relates inputs to outputs
- A guess at how inputs and outputs are related

but  $y = B_0 + B_I x_I + ...$  is just a guess/estimate; it's not exactly true

- A set of assumptions we're imposing on the dataset
   We're assuming output is linearly related to input features
- A configurable thing (hyperparameters)
   Sorry, we don't cover very much linear regression configuration here

Use algorithm to "learn" parameters that give us this line of best fit

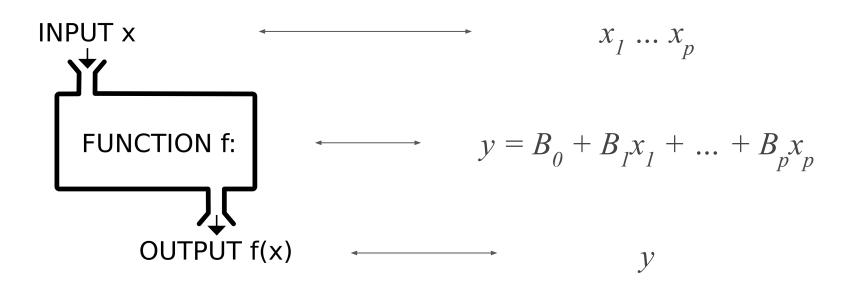

$$y = B_0 + B_1 x$$

## **Linear Regression**

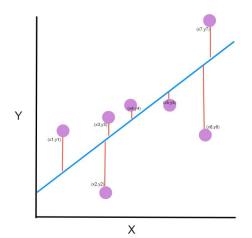

#### **Function**

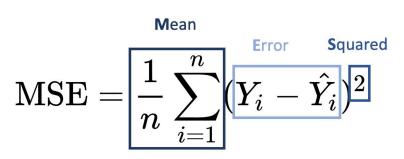

## **Linear Regression: Ordinary Least Squares**

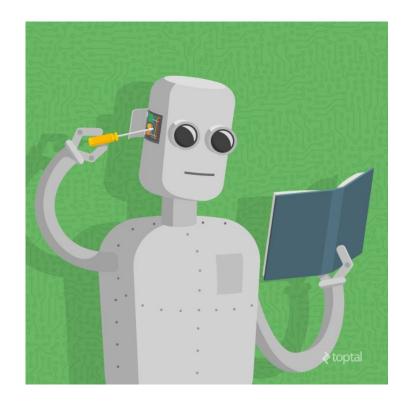

- Ordinary least squares method of linear regression calculates the weight vector B by minimizing the mean-squared error of the predicted y-values
- Other types of linear regression (i.e. ridge regression) use different loss functions to calculate the weights

## What's Machine Learning? Part 4: What makes a good model?

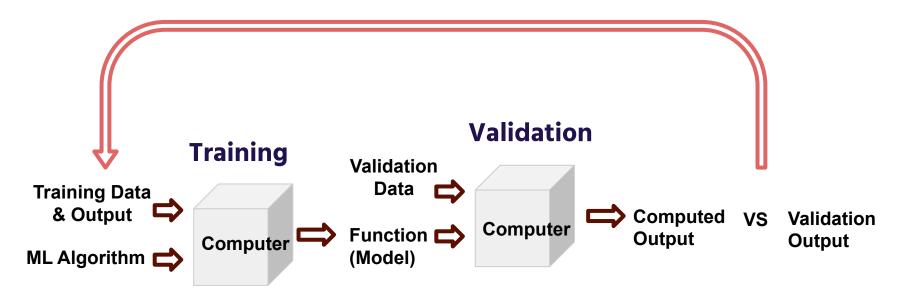

### **Terminology: Training and Validating**

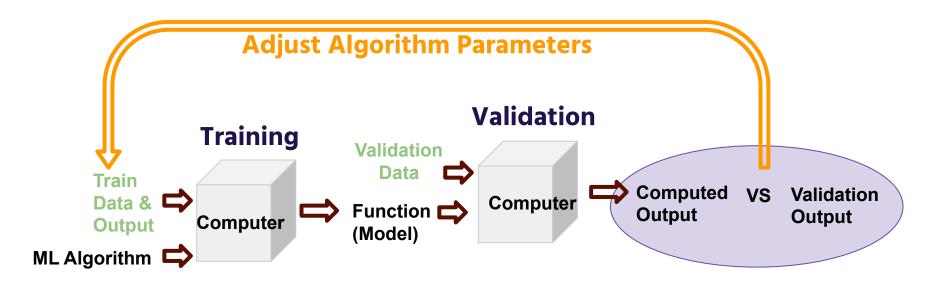

- Split data into two sets
- Train model on one, validate on the other
- "Model training" = learn a relationship/program
  - $\circ$  e.g. give the linear regression data so it can define the B's
- "Model validation" = see if the learned relationship is accurate on other data

### **Our ML Workflow**

- 1. Select data
- 2. Assess model accuracy
- 3. Adjust Model

## **Pitfall of Training: Overfitting**

Just right! overfitting

Model is accurate for **train** data

Model can accurately predict **new** data

- We learned the specific mapping from train input to train outputs...
- But, we didn't learn the data's general patterns cc

Solution: train on part of data, and check accuracy on a separate part of data (validation set)

### **Pitfall of Validation: Overfitting**

Predicting well on validation set

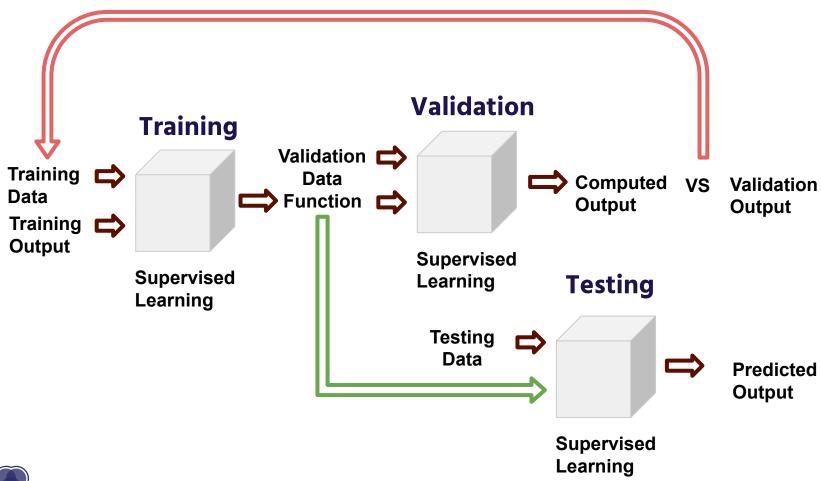

Predicting well on new data

- We used the validation set to make our adjustments.
  - ⇒ Our model is **biased** to the validation set. 🙂 🙂

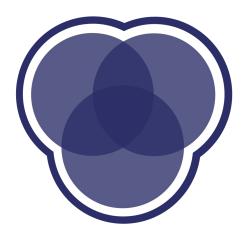

Solution: keep a separate, rarely-used *test* set

# **Demo**

#### **Model Goals**

When training a model we want our models to:

- Capture the trends of the training data
- Generalize well to other samples of the population
- Be moderately interpretable

The first two are especially difficult to do simultaneously!
The more sensitive the model, the less generalizable and vice versa.

## Things to Keep In Mind

Linear Regression is just one algorithm — we'll cover many more!

- The "model" produced by an algorithm is not always a simple equation like in linear regression.
- Validation is *really* important.
  - Overfitting is a huge problem!
  - We'll delve deeper in the next few lectures...

## **Coming Up**

**Assignment 3:** Due tonight at 11:59pm EST

Assignment 4: Due at 11:59pm EST on October 9th

Next Lecture: Assessing Model Accuracy + Fundamentals of ML

(a.k.a. What's Machine Learning? Part ∞)
